

CURIOUS BOX

Today at school, we carried out the Bright World activity, experiencing the excitement of creating Ames' room and discovering that vision depends on light. By examining the appearances of objects, we observed how light affects our visual perception.

At home, you can make a similar observation by placing objects of the same size inside a space. Observing how the same objects look different under various lighting conditions can help develop your child's visual perception and attention.

Stay curious and keep exploring with science!
