

CURIOUS BOX

Today at school, we carried out the "Conductivity Hunters" activity and explored how electricity is conducted.

By adding different materials to a circuit, we observed which ones conduct electricity (conductors) and which ones do not (insulators). In this way, we learned about the relationship between electricity and the materials we use in our daily lives.

At home, you can ask your child the following question:

"Which materials conduct electricity and which do not? Can you give examples from home?"

Stay curious and keep exploring science!

CONDUCTIVITY HUNTERS
