

Today, we explored the concept of density and its importance for living things with our future scientists!

In particular, we compared the densities of water in its solid and liquid states and learned about the effects of this difference in nature. We also designed and built a marine vehicle and discussed how its movement is related to the density of water.

At home, you can examine the densities of different materials and observe whether they sink or float in various liquids.

Stay curious and stay scientific!

LET'S BUILD A SEA  
VEHICLE
