

# CURIOUS BOX

Today at school, we carried out the Science and Technology experiment, testing whether substances are acidic or basic. We used indicators to determine these properties and explored the chemical structure of the substances.

At home, you can try this with your child by using indicators to test the acid-base properties of different substances you're curious about. These experiments will not only increase your child's curiosity and understanding in chemistry, but also help develop scientific thinking and observation skills.

Stay curious and keep exploring with science!
