

Today at school, we created our own terrariums with our future scientists.

We explored the importance of biodiversity for natural life and observed how ecosystems with different living organisms remain balanced. By examining the relationships between plants, soil, and water, we drew conclusions about why biodiversity is crucial for the continuity of ecosystems and for the survival of living beings.

At home, you can explore the terrarium together and discuss how the organisms interact with each other and their environment to reinforce this learning.

Stay curious and keep exploring science!

I'M MAKING A
TERRARIUM
