

Today at school, we carried out the “Periscope” activity and explored the concept of light reflection.

During the activity, our students designed their own periscope models and observed how light changes direction by reflecting off mirrors. They discovered through hands-on experience that light can reflect in two ways: regular reflection and diffuse reflection.

At home, you can support your child’s learning process by asking questions such as: “Why does the image you see in the periscope change direction?”

Stay curious and keep exploring science!

PERISCOPE
